good

# Assumptions

- you launch elements outside your site's usual functionality
- you're responsible for overall quality somehow
- you don't like things to suck

problems

# 4 principles and 7 techniques

1. Don't assume it works.
2. Remember the humans.
3. It's not paranoia if they really *are* trying to hack you.
4. Let things break well.

1. Time
2. Notes
3. Instructions
4. Variations and mutations
5. The end of the pipe
6. That little voice
7. Watching for value

# 4 principles

<http://8to.me/everything-is-broken>

#1

Don't assume it works.

#2

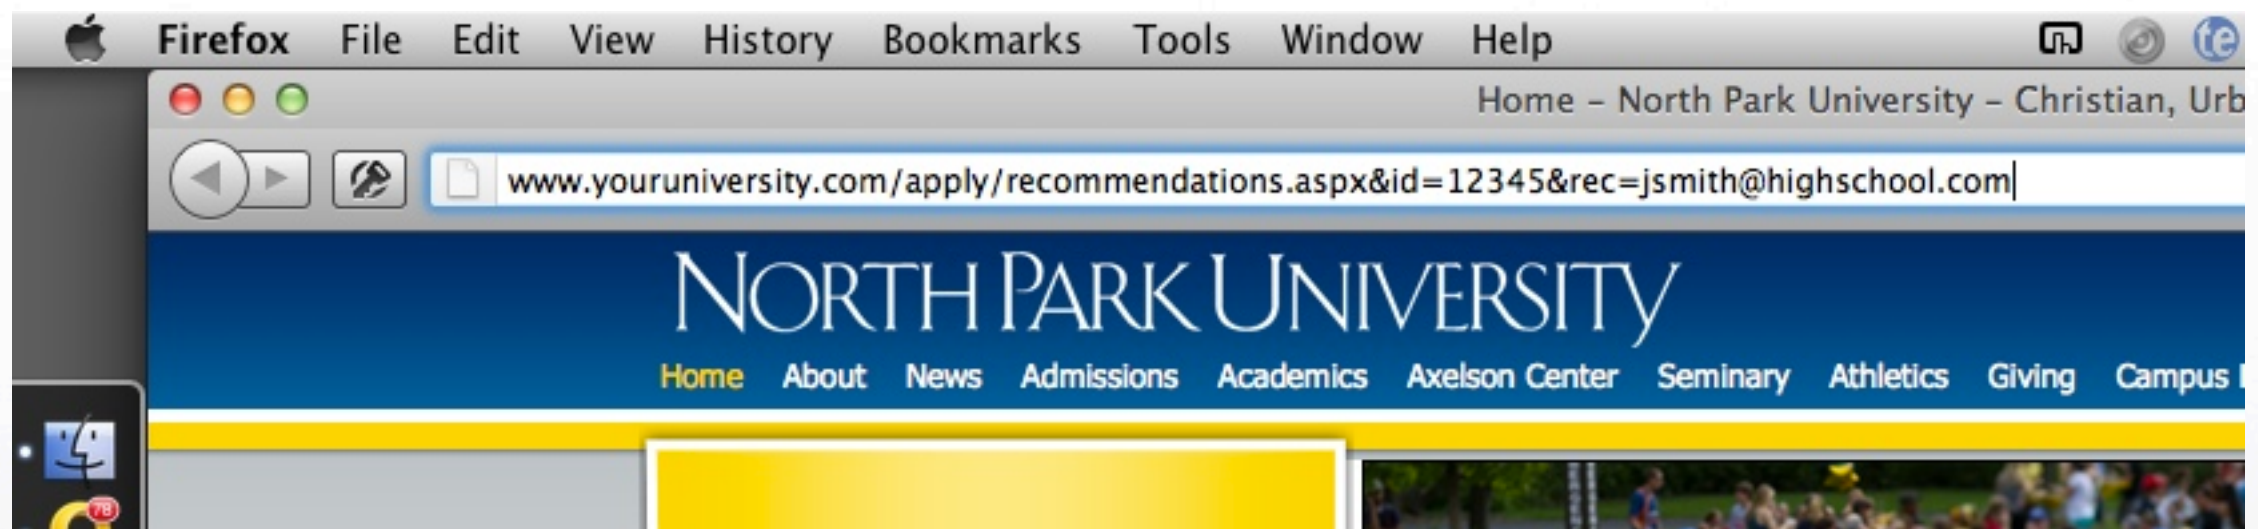

Remember the humans.

# #3

It's not paranoia  
if they really *are* trying  
to hack you.

#4

Let things break *well*.

# 7 techniques

#1

Take the time to test.

# #2

Take great notes and  
write great bug reports.

# Bug-noting resources

- <http://8to.me/bug-reports>
- Acrobat Pro for annotated PDFs
- Notable — [notableapp.com](http://notableapp.com)
- Bugherd — [bugherd.com](http://bugherd.com)
- FogBugz — [fogcreek.com/fogbugz](http://fogcreek.com/fogbugz)

# #3

Pay attention to  
instructions — then  
violate them.

#4

Don't try it only once.  
Variations are revealing.

#5

Watch the other end of  
the pipe.

# Results of their actions

- Confirmation pages and emails to the user
- Notification emails to you
- Insist on seeing the admin interface

#6

Listen to that nagging  
little voice — because  
no, it *won't* be OK.
